(54) Title: HAV PROBES FOR USE IN SOLUTION PHASE SANDWICH HYBRIDIZATION ASSAYS

(57) Abstract

Novel DNA probe sequences for detection of HAV in a sample in a solution phase sandwich hybridization assay are described. Amplified nucleic acid hybridization assays using the probes are exemplified.

HAV PROBES FOR USE IN SOLUTION PHASE SANDWICH HYBRIDIZATION ASSAYS

DESCRIPTION

Technical Field

This invention is in the field of nucleic acid hybridization assays. More specifically, it relates to novel nucleic acid probes for detecting Hepatitis A Virus (HAV).

Background Art

Hepatitis A virus is an RNA virus belonging to the picornavirus family and is thought to be responsible for at least 38% of all reported cases of hepatitis. Cohen et al. (J. Virol. 61:50-59, 1987) described the complete nucleotide sequence of wild-type Hepatitis A virus and compared the sequence with laboratory-adapted HAV strains and with other picornaviruses, finding most amino acid differences occurred in the capsid region, whereas most nucleotide differences occurred randomly throughout the genome.

Commonly owned U.S. 4,868,105 describes a solution phase nucleic acid sandwich hybridization assay in which analyte nucleic acid is first hybridized in solution to a labeling probe set and to a capturing probe set in a first vessel. The probe-analyte complex is then transferred to a second vessel that contains a solid-phase-immobilized probe that is complementary to a segment of the capturing probes. The segments hybridize to the immobilized probe, thus removing the complex from solution. Having the analyte in the form of an immobilized complex facilitates subsequent separation steps in the assay. Ultimately, single stranded segments

of the labeling probe set are hybridized to labeled probes, thus permitting the analyte-containing complex to be detected via a signal generated directly or indirectly from the label.

Commonly owned European Patent Application (EPA) 883096976 discloses a variation in the assay described in U.S. 4,868,105 in which the signal generated by the labeled probes is amplified. The amplification involves the use of nucleic acid multimers. These multimers are branched polynucleotides that are constructed to have a segment that hybridizes specifically to the analyte nucleic acid or to a nucleic acid (branched or linear) that is bound to the analyte and iterations of a second segment that hybridize specifically to the labeled probe. In the assay employing the multimer, the initial steps of hybridizing the analyte to label or amplifier probe sets and capturing probe sets in a first vessel and transferring the complex to another vessel containing immobilized nucleic acid that will hybridize to a segment of the capturing probes are followed. The multimer is then hybridized to the immobilized complex and the labeled probes in turn hybridized to the second segment iterations on the multimer. Since the multimers provide a large number of sites for label probe attachment, the signal is amplified. Amplifier and capture probe sequences are disclosed for Hepatitis B virus, Neisseria gonorrhoeae, penicillin and tetracycline resistance in N. gonorrhoeae, and Chlamydia trachomatis.

Commonly owned copending application Serial No. 558,897, filed 27 July 1990, describes the preparation of large comb-type branched polynucleotide multimers for use in the above-described solution phase assay. The combs provide greater signal enhancement in the assays than the smaller multimers.

Disclosure of the Invention

One aspect of the invention is a synthetic oligonucleotide useful as an amplifier probe in a sandwich hybridization assay for HAV comprising a first segment having a nucleotide sequence substantially complementary to a segment of HAV nucleic acid, and a second segment having a nucleotide sequence substantially complementary to an oligonucleotide acid multimer.

Another aspect of the invention is a synthetic oligonucleotide useful as a capture probe in a sandwich hybridization assay for HAV comprising a first segment having a nucleotide sequence substantially complementary to a segment of HAV nucleic acid; and a second segment having a nucleotide sequence substantially complementary to an oligonucleotide bound to a solid phase.

Another aspect of the invention is a solution sandwich hybridization assay for detecting the presence of HAV in a sample, comprising

(a) contacting the sample under hybridizing conditions with an excess of (i) an amplifier probe oligonucleotide comprising a first segment having a nucleotide sequence substantially complementary to a segment of HAV nucleic acid and a second segment having a nucleotide sequence substantially complementary to an oligonucleotide unit of a nucleic acid multimer and (ii) a capture probe oligonucleotide comprising a first segment having a nucleotide sequence that is substantially complementary to a segment of HAV nucleic acid and a second segment that is substantially complementary to an oligonucleotide bound to a solid phase;

(b) contacting the product of step (a) under hybridizing conditions with said oligonucleotide bound to the solid phase;

(c) thereafter separating materials not bound to the solid phase;

(d) contacting the product of step (c) under hybridization conditions with the nucleic acid multimer, said multimer comprising at least one oligonucleotide unit that is substantially complementary to the second segment of the amplifier probe polynucleotide and a multiplicity of second oligonucleotide units that are substantially complementary to a labeled oligonucleotide;

(e) removing unbound multimer;

(f) contacting under hybridizing conditions the solid phase complex product of step (e) with the labeled oligonucleotide;

(g) removing unbound labeled oligonucleotide; and

(h) detecting the presence of label in the solid phase complex product of step (g).

Another aspect of the invention is a kit for the detection of HAV comprising a kit for the detection of HAv in a sample comprising in combination

(i) a set of amplifier probe oligonucleotides wherein the amplifier probe oligonucleotide comprises a first segment having a nucleotide sequence substantially complementary to a segment of HAV nucleic acid and a second segment having a nucleotide sequence substantially complementary to an oligonucleotide unit of a nucleic acid multimer;

(ii) a set of capture probe oligonucleotides wherein the capture probe oligonucleotide comprises a first segment having a nucleotide sequence that is substantially complementary to a segment of HAV nucleic acid and a second segment that is substantially complementary to an oligonucleotide bound to a solid phase;

(iii) a nucleic acid multimer, said multimer comprising at least one oligonucleotide unit that is substantially complementary to the second segment of the amplifier probe polynucleotide and a multiplicity of

second oligonucleotide units that are substantially complementary to a labeled oligonucleotide; and

(iv) a labeled oligonucleotide.

Modes for Carrying Out the Invention

Definitions

"Solution phase nucleic acid hybridization assay" intends the assay techniques described and claimed in commonly owned U.S. Patent No. 4,868,105 and EPA 883096976.

A "modified nucleotide" intends a nucleotide monomer that may be stably incorporated into a polynucleotide and which has an additional functional group. Preferably, the modified nucleotide is a 5'-cytidine in which the N^4-position is modified to provide a functional hydroxy group.

An "amplifier multimer" intends a branched polynucleotide that is capable of hybridizing simultaneously directly or indirectly to analyte nucleic acid and to a multiplicity of polynucleotide iterations (i.e., either iterations of another multimer or iterations of a labeled probe). The branching in the multimers is effected through covalent bonds and the multimers are composed of two types of oligonucleotide units that are capable of hybridizing, respectively, to analyte nucleic acid or nucleic acid hybridized to analyte nucleic acid and to a multiplicity of labeled probes. The composition and preparation of such multimers are described in EPA 883096976 and U.S. Serial No. 558,897 filed 27 July 1990, the disclosures of which are incorporated herein by reference.

The term "amplifier probe" is intended as a branched or linear polynucleotide that is constructed to have a segment that hybridizes specifically to the analyte nucleic acid and iterations of a second segment that hybridize specifically to an amplifier multimer.

The term "capture probe" is intended as an oligonucleotide having a segment substantially complementary to a nucleotide sequence of the target DNA and a segment that is substantially complementary to a nucleotide sequence of a solid-phase-immobilized probe.

"Large" as used herein to describe the comb-type branched polynucleotides of the invention intends a molecule having at least about 15 branch sites and at least about 20 iterations of the labeled probe binding sequence.

"Comb-type" as used herein to describe the structure of the branched polynucleotides of the invention intends a polynucleotide having a linear backbone with a multiplicity of sidechains extending from the backbone.

A "cleavable linker molecule" intends a molecule that may be stably incorporated into a polynucleotide chain and which includes a covalent bond that may be broken or cleaved by chemical treatment or physical treatment such as by irradiation.

All nucleic acid sequences disclosed herein are written in a 5′ to 3′ direction. Nucleotides are designated according to the nucleotide symbols recommended by the IUPAC-IUB Biochemical Nomenclature Commission. All nucleotide sequences disclosed are intended to include complementary sequences unless otherwise indicated.

Solution Phase Hybridization Assay

The general protocol for the solution phase sandwich hybridizations is as follows. The analyte nucleic acid is placed in a microtiter well with an excess of two single-stranded nucleic acid probe sets: (1) a set of capture probes, each having a first binding sequence substantially complementary to the analyte and a second binding sequence that is substantially complementary to nucleic acid bound to a solid support,

for example, the well surface or a bead, and (2) a set of amplifier probes (branched or linear), each having a first binding sequence that is capable of specific binding to the analyte and a second binding sequence that is capable of specific binding to a segment of the multimer. The resulting product is a three component nucleic acid complex of the two probes hybridized to the analyte by their first binding sequences. The second binding sequences of the probes remain as single-stranded segments as they are not substantially complementary to the analyte. This complex hybridizes to the immobilized probe on the solid surface via the second binding sequence of the capture probe. The resulting product comprises the complex bound to the solid surface via the duplex formed by the oligonucleotide bound to the solid surface and the second binding sequence of the capture probe. Unbound materials are then removed from the surface such as by washing.

The amplification multimer is then added to the bound complex under hybridization conditions to permit the multimer to hybridize to the available second binding sequence(s) of the amplifier probe of the complex. The resulting complex is then separated from any unbound multimer by washing. The labeled oligonucleotide is then added under conditions which permit it to hybridize to the complementary oligonucleotide units of the multimer. The resulting immobilized labeled nucleic acid complex is then washed to remove unbound labeled oligonucleotide, and read.

The analyte nucleic acids may be from a variety of sources, e.g., biological fluids or solids, and may be prepared for the hybridization analysis by a variety of means, e.g., proteinase K/SDS, chaotropic salts, etc. Also, it may be of advantage to decrease the average size of the analyte nucleic acids by enzymatic, physical or chemical means, e.g., restriction enzymes, sonication, chemical degradation (e.g., metal ions), etc. The frag-

ments may be as small as 0.1 kb, usually being at least about 0.5 kb and may be 1 kb or higher. The analyte sequence is provided in single-stranded form for analysis. Where the sequence is naturally present in single-stranded form, denaturation will not be required. However, where the sequence may be present in double-stranded form, the sequence should be denatured. Denaturation can be carried out by various techniques, such as alkali, generally from about 0.05 to 0.2 M hydroxide, formamide, salts, heat, enzymes, or combinations thereof.

The first binding sequences of the capture probe and amplifier probe that are substantially complementary to the analyte sequence will each be of at least 15 nucleotides, usually at least 25 nucleotides, and not more than about 5 kb, usually not more than about 1 kb, preferably not more than about 100 nucleotides. They will typically be approximately 30 nucleotides. They will normally be chosen to bind to different sequences of the analyte. The first binding sequences may be selected based on a variety of considerations. Depending upon the nature of the analyte, one may be interested in a consensus sequence, a sequence associated with polymorphisms, a particular phenotype or genotype, a particular strain, or the like.

The number of different amplifier and capture probes used influences the sensitivity of the assay, because the more probe sequences used, the greater the signal provided by the assay system. Furthermore, the use of more probe sequences allows the use of more stringent hybridization conditions, thereby reducing the incidence of false positive results. Thus, the number of probes in a set will be at least one capture probe and at least one amplifier probe, more preferably two capture and two amplifier probes, and most preferably 5-100 capture probes and 5-100 amplifier probes.

Oligonucleotide probes for HAV were designed by aligning the RNA sequences of five HAV isolates available from GenBank. Regions of greatest homology were chosen for capture probes, while regions of lesser homology were chosen as amplifier probes. Thus, as additional strains or isolates of HAV are made available, appropriate probes made be designed by aligning the sequence of the new strain or isolate with the nucleotide sequences used to design the probes of the present invention, and choosing regions of greatest homology for use as capture probes, with regions of lesser homology chosen as amplifier probes. The probe sequences of the presently preferred probe sets are contiguous and roughly correspond to nucleotides 1-1300 of the HAV genome. The nucleotide sequences of the presently preferred probe sets are shown in the examples.

The second binding sequences of the capture probe and amplifier probe are selected to be substantially complementary, respectively, to the oligonucleotide bound to the solid surface and to a segment of the multimer and so as to not be encountered by endogenous sequences in the sample/analyte. The second binding sequence may be contiguous to the first binding sequence or be spaced therefrom by an intermediate noncomplementary sequence. The probes may include other noncomplementary sequences if desired. These noncomplementary sequences must not hinder the binding of the binding sequences or cause nonspecific binding to occur.

The capture probe and amplifier probe may be prepared by oligonucleotide synthesis procedures or by cloning, preferably the former.

It will be appreciated that the binding sequences need not have perfect complementarity to provide homoduplexes. In many situations, heteroduplexes will suffice where fewer than about 10% of the bases are mismatches, ignoring loops of five or more nucleotides.

Accordingly, as used herein the term "complementary" intends exact complementarity wherein each base within the binding region corresponds exactly, and "substantially complementary" intends 90% or greater homology.

The labeled oligonucleotide will include a sequence substantially complementary to the repeated oligonucleotide units of the multimer. The labeled oligonucleotide will include one or more molecules ("labels"), which directly or indirectly provide a detectable signal. The labels may be bound to individual members of the substantially complementary sequence or may be present as a terminal member or terminal tail having a plurality of labels. Various means for providing labels bound to the oligonucleotide sequences have been reported in the literature. See, for example, Leary et al., Proc. Natl. Acad. Sci. USA (1983) 80:4045; Renz and Kurz, Nucl. Acids Res. (1984) 12:3435; Richardson and Gumport, Nucl. Acids Res. (1983) 11:6167; Smith et al., Nucl. Acids. Res. (1985) 13:2399; Meinkoth and Wahl, Anal. Biochem. (1984) 138:267. The labels may be bound either covalently or non-covalently to the substantially complementary sequence. Labels which may be employed include radionuclides, fluorescers, chemiluminescers, dyes, enzymes, enzyme substrates, enzyme cofactors, enzyme inhibitors, enzyme subunits, metal ions, and the like. Illustrative specific labels include fluorescein, rhodamine, Texas red, phycoerythrin, umbelliferone, luminol, NADPH, α-ß-galactosidase, horseradish peroxidase, alkaline phosphatase, etc.

The ratio of capture probe and amplifier probe to anticipated moles of analyte will each be at least stoichiometric and preferably in excess. This ratio is preferably at least about 1.5:1, and more preferably at least 2:1. It will normally be in the range of 2:1 to 10^6:1. Concentrations of each of the probes will generally range from about 10^{-5} to 10^{-9} M, with sample nucleic

acid concentrations varying from 10^{-21} to 10^{-12} M. The hybridization steps of the assay will generally take from about 10 minutes to 20 hours, frequently being completed in about 1 hour. Hybridization can be carried out at a mildly elevated temperature, generally in the range from about 20°C to 80°C, more usually from about 35°C to 70°C, particularly 65°C.

The hybridization reactions are usually done in an aqueous medium, particularly a buffered aqueous medium, which may include various additives. Additives which may be employed include low concentrations of detergent (0.01 to 1%), salts, e.g., sodium citrate (0.017 to 0.17 M), Ficoll, polyvinylpyrrolidone, carrier nucleic acids, carrier proteins, etc. Nonaqueous solvents may be added to the aqueous medium, such as dimethylformamide, dimethylsulfoxide, alcohols, and formamide. These other solvents are generally present in amounts ranging from 2 to 50%.

The stringency of the hybridization medium may be controlled by temperature, salt concentration, solvent system, and the like. Thus, depending upon the length and nature of the sequence of interest, the stringency will be varied.

Depending upon the nature of the label, various techniques can be employed for detecting the presence of the label. For fluorescers, a large number of different fluorometers are available. For chemiluminescers, luminometers or films are available. With enzymes, a fluorescent, chemiluminescent, or colored product can be provided and determined fluorometrically, luminometrically, spectrophotometrically or visually. The various labels which have been employed in immunoassays and the techniques applicable to immunoassays can be employed with the subject assays.

Kits for carrying out amplified nucleic acid hybridization assays according to the invention will comprise in packaged combination the following reagents:

the amplifier probe or set of probes; the capture probe or set of probes; the amplifier multimer; and an appropriate labeled oligonucleotide. These reagents will typically be in separate containers in the kit. The kit may also include a denaturation reagent for denaturing the analyte, hybridization buffers, wash solutions, enzyme substrates, negative and positive controls and written instructions for carrying out the assay.

The following examples further illustrate the invention. These examples are not intended to limit the invention in any manner.

EXAMPLES

Example I

Synthesis of Comb-type Branched Polynucleotide

This example illustrates the synthesis of a comb-type branched polynucleotide having 15 branch sites and sidechain extensions having three labeled probe binding sites. This polynucleotide was designed to be used in a solution phase hybridization as described in EPA 883096976.

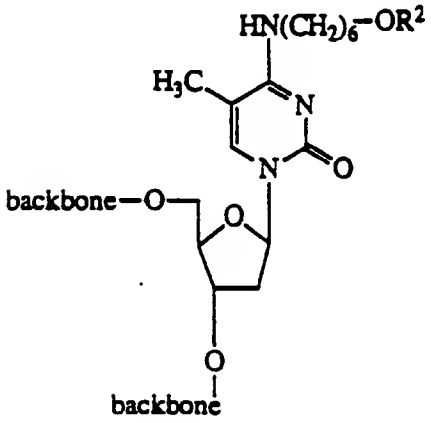
All chemical syntheses of oligonucleotides were performed on an automatic DNA synthesizer (Applied Biosystems, Inc., (ABI) model 380 B). Phosphoramidite chemistry of the beta cyanoethyl type was used including 5'-phosphorylation which employed Phostel™ reagent (ABN). Standard ABI protocols were used except as indicated. Where it is indicated that a multiple of a cycle was used (e.g., 1.2 cycle), the multiple of the standard amount of amidite recommended by ABI was employed in the specified cycle. Appended hereto are the programs for carrying out cycles 1.2 and 6.4 as run on the Applied Biosystems Model 380 B DNA Synthesizer.

A comb body of the following structure was first prepared:

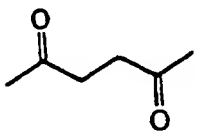
$$3'T_{18}(TTX')_{15}GTTTGTGG\text{-}5'$$
$$|$$
$$(RGTCAGTp\text{-}5')_{15}$$

wherein X' is a branching monomer, and R is a periodate cleavable linker.

The portion of the comb body through the 15 (TTX') repeats is first synthesized using 33.8 mg aminopropyl-derivatized thymidine controlled pore glass (CPG) (2000 Å, 7.4 micromoles thymidine per gram support) with a 1.2 cycle protocol. The branching site nucleotide was of the formula:



where R^2 represents



For synthesis of the comb body (not including sidechains), the concentration of beta cyanoethylphosphoramidite monomers was 0.1 M for A, C, G and T, 0.15 M for the branching site monomer E, and 0.2 M for Phostel™ reagent. Detritylation was done with 3% trichloroacetic acid in methylene chloride using stepped flowthrough for the duration of the deprotection. At the conclusion the 5′ DMT was replaced with an acetyl group.

Cleavable linker R and six base sidechain extensions of the formula 3′-RGTCAGTp (SEQ ID NO:1) were synthesized at each branching monomer site as follows. The base protecting group removal (R^2 in the formula above) was performed manually while retaining the CPG support in the same column used for synthesizing the comb body. In the case of R^2 = levulinyl, a solution of 0.5 M hydrazine hydrate in pyridine/glacial acetic acid (1:1 v/v) was introduced and kept in contact with the CPG support for 90 min with renewal of the liquid every 15 min, followed by extensive washing with pyridine/glacial acetic acid (1:1 v/v) and then by acetonitrile. After the deprotection the cleavable linker R and six base sidechain extensions were added using a 6.4 cycle.

In these syntheses the concentration of phosphoramidites was 0.1 M (except 0.2 M R and Phostel™ reagent; R was 2-(4-(4-(2-Dimethoxytrityloxy)ethyl-)phenoxy 2,3-di(benzoyloxy)-butyloxy)phenyl)ethyl-2-cyanoethyl-N,N-diisopropylphosphoramidite).

Detritylation is effected with a solution of 3% trichloroacetic acid in methylene chloride using continuous flowthrough, followed by a rinse solution of toluene/chloromethane (1:1 v/v). Branched polynucleotide chains were removed from the solid supports automatically in the 380B using the cycle "CE NH_3." The ammonium hydroxide solution was collected in 4 ml screw-capped Wheaton vials and heated at 60°C for 12 hr to remove all base-protecting groups. After cooling

to room temperature the solvent was removed in a Speed-Vac evaporator and the residue dissolved in 100 µl water.

3′ backbone extensions (segment A), sidechain extensions and ligation template/linkers of the following structures were also made using the automatic synthesizer:

3′ Backbone extension	3′-TCCGTATCCTGGGCACAGAGGTGCp-5′ (SEQ ID NO:2)
Sidechain extension	3′-GATGCG(TTCATGCTGTTGGTGTAG)$_3$-5′ (SEQ ID NO:3)
Ligation template for linking 3′ backbone extension	3′-AAAAAAAAAAGCACCTp-5′ (SEQ ID NO:4)
Ligation template for linking sidechain extension	3′-CGCATCACTGAC-5′ (SEQ ID NO:5)

The crude comb body was purified by a standard polyacrylamide gel (7% with 7 M urea and 1X TBE running buffer) method.

The 3′ backbone extension and the sidechain extensions were ligated to the comb body as follows. The comb body (4 pmole/μl), 3′ backbone extension (6.25 pmole/μl), sidechain extension (93.75 pmole/μl), sidechain linking template (75 pmoles/μl) and backbone linking template (5 pmole/μl) were combined in 1 mM ATP/ 5 mM DTT/ 50 mM Tris-HCl, pH 8.0/ 10 mM $MgCl_2$/ 2 mM spermidine, with 0.5 units/μl T4 polynucleotide kinase. The mixture was incubated at 37°C for 2 hr, then heated in a water bath to 95°C, and then slowly cooled to below 35°C over a 1 hr period. 2 mM ATP, 10 mM DTT, 14% polyethylene glycol, and 0.21 units/μl T4 ligase were added, and the mixture incubated for 16-24 hr at 23°C. The DNA was precipitated in NaCl/ethanol, resuspended in water, and subjected to a second ligation as follows. The mixture was adjusted to 1 mM ATP, 5 mM DTT, 14% polyethylene glycol, 50 mM Tris-HCl, pH 7.5, 10 mM $MgCl_2$, 2 mM spermidine, 0.5 units/μl T4 polynucleotide kinase, and 0.21 units/μl T4 ligase were added, and the mixture incubated at 23°C for 16-24 hr. Ligation products were then purified by polyacrylamide gel electrophoresis.

After ligation and purification, a portion of the product was labeled with ^{32}P and subjected to cleavage at the site of R achieved by oxidation with aqueous $NaIO_4$ for 1 hr. The sample was then analyzed by PAGE to determine the number of sidechain extensions incorporated by quantitating the radioactive label in the bands on the gel. The product was found to have a total of 45 labeled probe binding sites.

Example II

Procedure for HAV Assay

A "15 X 3" amplified solution phase nucleic acid sandwich hybridization assay format was used in this assay. The "15 x 3" designation derives from the fact that the format employs two multimers: (1) an amplifier probe having a first segment (A) that binds to HAV and a second segment (B) that hybridizes to (2) an amplifier multimer having a first segment (B*) that hybridizes to the segment (B) and fifteen iterations of a segment (C), wherein segment C hybridizes to three labeled oligonucleotides.

The amplifier and capture probe segments and their respective names used in this assay were as follows.

Each amplifier probe contained, in addition to the sequences substantially complementary to the HAV sequences, the following 5′ extension complementary to a segment of the amplifier multimer,

AGGCATAGGACCCGTGTCTT (SEQ ID NO:38).

Each capture probe contained, in addition to the sequences substantially complementary to HAV RNA, a downstream sequence complementary to DNA bound to the solid phase (XT1*),

CTTCTTTGGAGAAAGTGGTG (SEQ ID NO:39).

Microtiter plates were prepared as follows. White Microlite 1 Removawell strips (polystyrene microtiter plates, 96 wells/plate) were purchased from Dynatech Laboratories, Inc. Each well was filled with 200 µl 1 N HCl and incubated at room temperature for 15-20 min. The plates were then washed 4 times with 1X PBS and the wells aspirated to remove liquid. The wells were then filled with 200 µl 1 N NaOH and incubated at room temperature for 15-20 min. The plates were again washed 4 times with 1X PBS and the wells aspirated to remove liquid.

Poly(phe-lys) was purchased from Sigma Chemicals, Inc. This polypeptide has a 1:1 molar ratio of phe:lys and an average m.w. of 47,900 gm/mole. It has an average length of 309 amino acids and contains 155 amines/mole. A 1 mg/ml solution of the polypeptide was mixed with 2M NaCl/1X PBS to a final concentration of 0.1

mg/ml (pH 6.0). 100 µL of this solution was added to each well. The plate was wrapped in plastic to prevent drying and incubated at 30°C overnight. The plate was then washed 4 times with 1X PBS and the wells aspirated to remove liquid.

The following procedure was used to couple the oligonucleotide XT1* to the plates. Synthesis of XT1* was described in EPA 883096976. 20 mg disuccinimidyl suberate was dissolved in 300 µl dimethyl formamide (DMF). 26 OD_{260} units of XT1* was added to 100 µl coupling buffer (50 mM sodium phosphate, pH 7.8). The coupling mixture was then added to the DSS-DMF solution and stirred with a magnetic stirrer for 30 min. An NAP-25 column was equilibrated with 10 mM sodium phosphate, pH 6.5. The coupling mixture DSS-DMF solution was added to 2 ml 10 mM sodium phosphate, pH 6.5, at 4°C. The mixture was vortexed to mix and loaded onto the equilibrated NAP-25 column. DSS-activated XT1* DNA was eluted from the column with 3.5 ml 10 mM sodium phosphate, pH 6.5. 5.6 OD_{260} units of eluted DSS-activated XT1* DNA was added to 1500 ml 50 mM sodium phosphate, pH 7.8. 50 µl of this solution was added to each well and the plates were incubated overnight. The plate was then washed 4 times with 1X PBS and the wells aspirated to remove liquid.

Final stripping of plates was accomplished as follows. 200 µL of 0.2N NaOH containing 0.5% (w/v) SDS was added to each well. The plate was wrapped in plastic and incubated at 65°C for 60 min. The plate was then washed 4 times with 1X PBS and the wells aspirated to remove liquid. The stripped plate was stored with desiccant beads at 2-8°C.

The HAV-infected cell culture (100% HAV infected FRhK4 cell line) and the uninfected cell culture (FRhK4 cell line) were prepared as follows.

Cells were trypsinized in STV (equal parts 0.25% trypsin and 1:2000 versene (Sigma Chemical Co.) in

PBS) and resuspended in 5 ml of the medium (DMEM with 20% FBS) the cells were grown in. The cells were then counted in a hemocytometer and diluted to 10^5 cells/10 μl, 10^4 cells/10 μl, 10^3 cells/10 μl, and 10^2 cells/10 μl.

A cocktail of the HAV-specific amplifier and capture probes was prepared in a proteinase K solution prepared by first adding 10 mg proteinase K to 5 ml capture diluent (53 mM Tris-HCl, pH 8.0/10.6 mM EDTA/1.3% SDS/16 μg/ml sonicated salmon sperm DNA/5.3X SSC/1 mg/ml proteinase K/ 7% formamide). The cocktail contained 50 fmoles of each probe in 30 μl buffer. 30 μl of this solution was added to each well. 10 μl of the appropriate dilution of the uninfected and infected cells as described above was then added to each well. Plates were covered and agitated to mix samples, then incubated at 65°C overnight.

The next morning the plates were cooled at room temperature for 10 minutes. The contents of each well were aspirated to remove all fluid, and the wells were washed 2X with washing buffer (0.1% SDS/0.015 M NaCl/ 0.0015 M sodium citrate). Amplifier multimer was then added to each well (20 fmoles/well in 4X SSC/ 0.1% SDS/ 0.5% Blocking Reagent (Boehringer Mannheim, catalog No. 1096 176)). After covering plates and agitating to mix the contents in the wells, the plates were incubated for 15 min at 65° C.

After a further 5-10 min period at room temperature, the wells were washed as described above.

Alkaline phosphatase label probe, disclosed in EP 883096976, was then added to each well (20 fmoles/well in 40 μl 4X SSC/0.1% SDS/0.5% Blocking Reagent). After incubation at 55°C for 15 min, and 5-10 min at room temperature, the wells were washed twice as above and then 3x with 0.015 M NaCl/0.0015 M sodium citrate.

An enzyme-triggered dioxetane (Schaap et al., Tet. Lett. (1987) 28:1159-1162 and EPA Pub. No. 0254051) obtained from Lumigen, Inc., was employed. The detection

procedure was as follows. 30 μl Lumiphos 530 (Lumigen) was added to each well. The wells were tapped lightly so that the reagent would fall to the bottom and gently swirled to distribute the reagent evenly over the bottom. The wells were covered and incubated at 37°C for 40 min.

Plates were then read on a Dynatech ML 1000 luminometer (Dynatech Laboratories, Inc.). Output was given as the full integral of the light produced during the reaction.

Results are shown in the Table below. Results for each standard sample are expressed as the difference between the mean of the negative control plus two standard deviations and the mean of the sample minus two standard deviations (delta). If delta is greater than zero, the sample is considered positive. These results indicate a sensitivity of about 10^3-10^4 HAV molecules.

Table

Sample	Amount	Delta
uninfected cells	10^5	--
uninfected cells	10^4	-0.26
uninfected cells	10^3	-0.25
uninfected cells	10^2	-0.16
HAV-infected cells	10^5	15.52
HAV-infected cells	10^4	2.59
HAV-infected cells	10^3	-0.09
HAV-infected cells	10^2	-0.03

Modifications of the above-described modes for carrying out the invention that are obvious to those of skill in biochemistry, nucleic acid hybridization assays, and related fields are intended to be within the scope of the following claims.

SEQUENCE LISTING

(1) GENERAL INFORMATION:

(i) APPLICANT: Kolberg, Janice A.
Urdea, Michael S.

(ii) TITLE OF INVENTION: HAV PROBES FOR USE IN SOLUTION PHASE SANDWICH HYBRIDIZATION ASSAYS

(iii) NUMBER OF SEQUENCES: 39

Claims

1. A synthetic oligonucleotide useful as an amplifier probe in a sandwich hybridization assay for HAV comprising

a first segment comprising a nucleotide sequence substantially complementary to a segment of HAV nucleic acid; and

a second segment comprising a nucleotide sequence substantially complementary to an oligonucleotide acid multimer,

wherein the HAV nucleic acid segment is selected from the group consisting of

ATAGAAGTATTAGCCTAAGAGGTTTCACCCGTA (SEQ ID NO:6),
CCGCCGCTGTTRCCCTATCCAARGCATCTCTTC (SEQ ID NO:7),
TGAATGGTTTTTGTCTTAACAACTCACCAATAT (SEQ ID NO:8),
GCATCCACTGGATGAGAGYCAGTCCTCCGGCGT (SEQ ID NO:9),
CTARAGACAGCCCTGACARTCAATCCACTCAAT (SEQ ID NO:10),
TTGCCCTAAGCACAGAGAGGTCTGRRATTAARC (SEQ ID NO:11),
TCTCACAGRATCCCATTTAAGGCCAAATGRTGT (SEQ ID NO:12),
AAGAACAGTCCAGCTGTCAATGGAGGGAYCCCC (SEQ ID NO:13),
GTACCTCAGAGGCAAACACCACATAAGGCCCCA (SEQ ID NO:14),
TTTAAGAATGAGGAAAAACCTAAATGCCCCTGA (SEQ ID NO:15),
GGAAAATWCCTTGTYTRGACATRTTCATTATTR (SEQ ID NO:16),
ACAGGATGTGGTCAAGRCCACTCCCRACAGTCT (SEQ ID NO:17),
GAATCATTTGCTCTTCCTCAATRTCTGCCAAAG (SEQ ID NO:18),
AAGCWCCAGTCACTGCAGTCCTAWCAACKGAYT (SEQ ID NO:19),
GAACTGAAGATTGRTCCACAGAAGTRAARTAAG (SEQ ID NO:20),
GTTCAAYYTGRTGTRAKCCAACCTCAGCWGTAT (SEQ ID NO:21),
TWGAACYRGGTTTATCAACAGAGGTTYTCAARG (SEQ ID NO:22),
GAATCARGAAAAAYTTYTCYCCCTGAGTYYTCT (SEQ ID NO:23),
ADAGAGCATGTGTAGTRAGCCAATCWGCAGAAT (SEQ ID NO:24),
RTTTCACCACRTCCAATTTTGCAACTTCATGRA (SEQ ID NO:25),
AMCCTTGRACRGCAAACTGCTCATTRTAYARTA (SEQ ID NO:26), and
TGCCAAATCTTGCATATGTRTGGTATCTCAACA (SEQ ID NO:27).

2. The synthetic oligonucleotide of claim 1, wherein said second segment comprises

AGGCATAGGACCCGTGTCTT (SEQ ID NO:38).

3. A synthetic oligonucleotide useful as a capture probe in a sandwich hybridization assay for HAV comprising

a first segment comprising a nucleotide sequence substantially complementary to a segment of HAV nucleic acid; and

a second segment comprising a nucleotide sequence substantially complementary to an oligonucleotide bound to a solid phase, wherein said first segment is selected from the group consisting of

CGCAACGGCCAGAGCCTAGGGCAAGGGGAGAGC (SEQ ID NO:28),
CTCCATGCTAATCATGGAGTTGACCCCGCCGGG (SEQ ID NO:29),
AMACATCTGYGTCCCCAATTTAGACTCCTACAG (SEQ ID NO:30),
GARAGCCAAGTTWACACTGCAAGGTGACGTYCC (SEQ ID NO:31),
GCCTACCCCTTGTGGAAGATCAAAGAGRTTCAT (SEQ ID NO:32),
ARGGTGTRGGRTTTATCTGAACTTGAATYTCAA (SEQ ID NO:33),
GAACCATRGCACARATYARYCCYCCYTGYTGRA (SEQ ID NO:34),
AKGATGCTATHGAACCATARCTYTGGTCACYAG (SEQ ID NO:35),
TGCAATTTAACARACCATGAGGATAAACAGTCA (SEQ ID NO:36), and
ATGGAACCTTTATTCTAACYACATTGTTRATRT (SEQ ID NO:37).

4. The synthetic oligonucleotide of claim 3, wherein said second segment comprises

CTTCTTTGGAGAAAGTGGTG (SEQ ID NO:39).

5. A set of synthetic oligonucleotides useful as amplifier probes in a sandwich hybridization assay for HAV comprising two oligonucleotides,

wherein each oligonucleotide comprises:

a first segment comprising a nucleotide sequence substantially complementary to a segment of HAV nucleic acid; and

a second segment comprising a nucleotide sequence substantially complementary to an oligonucleotide acid multimer,

wherein said HAV nucleic acid segment is selected from the group consisting of

ATAGAAGTATTAGCCTAAGAGGTTTCACCCGTA (SEQ ID NO:6),
CCGCCGCTGTTRCCCTATCCAARGCATCTCTTC (SEQ ID NO:7),
TGAATGGTTTTTGTCTTAACAACTCACCAATAT (SEQ ID NO:8),
GCATCCACTGGATGAGAGYCAGTCCTCCGGCGT (SEQ ID NO:9),
CTARAGACAGCCCTGACARTCAATCCACTCAAT (SEQ ID NO:10),
TTGCCCTAAGCACAGAGAGGTCTGRRATTAARC (SEQ ID NO:11),
TCTCACAGRATCCCATTTAAGGCCAAATGRTGT (SEQ ID NO:12),
AAGAACAGTCCAGCTGTCAATGGAGGGAYCCCC (SEQ ID NO:13),
GTACCTCAGAGGCAAACACCACATAAGGCCCCA (SEQ ID NO:14),
TTTAAGAATGAGGAAAAACCTAAATGCCCCTGA (SEQ ID NO:15),
GGAAAATWCCTTGTYTRGACATRTTCATTATTR (SEQ ID NO:16),
ACAGGATGTGGTCAAGRCCACTCCCRACAGTCT (SEQ ID NO:17),
GAATCATTTGCTCTTCCTCAATRTCTGCCAAAG (SEQ ID NO:18),
AAGCWCCAGTCACTGCAGTCCTAWCAACKGAYT (SEQ ID NO:19),
GAACTGAAGATTGRTCCACAGAAGTRAARTAAG (SEQ ID NO:20),
GTTCAAYYTGRTGTRAKCCAACCTCAGCWGTAT (SEQ ID NO:21),
TWGAACYRGGTTTATCAACAGAGGTTYTCAARG (SEQ ID NO:22),
GAATCARGAAAAAYTTYTCYCCCTGAGTYYTCT (SEQ ID NO:23),
ADAGAGCATGTGTAGTRAGCCAATCWGCAGAAT (SEQ ID NO:24),
RTTTCACCACRTCCAATTTTGCAACTTCATGRA (SEQ ID NO:25),
AMCCTTGRACRGCAAACTGCTCATTRTAYARTA (SEQ ID NO:26), and
TGCCAAATCTTGCATATGTRTGGTATCTCAACA (SEQ ID NO:27).

6. The synthetic oligonucleotide of claim 5, wherein said second segment comprises

AGGCATAGGACCCGTGTCTT (SEQ ID NO:38).

7. A set of synthetic oligonucleotides useful as capture probes in a sandwich hybridization assay for HAV comprising two oligonucleotides,

wherein each oligonucleotide comprises:

a first segment comprising a nucleotide sequence substantially complementary to a segment of HAV nucleic acid; and

a second segment comprising a nucleotide sequence substantially complementary to an oligonucleotide bound to a solid phase,

wherein said HAV nucleic acid segment is selected from the group consisting of

CGCAACGGCCAGAGCCTAGGGCAAGGGGAGAGC (SEQ ID NO:28),
CTCCATGCTAATCATGGAGTTGACCCCGCCGGG (SEQ ID NO:29),
AMACATCTGYGTCCCCAATTTAGACTCCTACAG (SEQ ID NO:30),
GARAGCCAAGTTWACACTGCAAGGTGACGTYCC (SEQ ID NO:31),
GCCTACCCCTTGTGGAAGATCAAAGAGRTTCAT (SEQ ID NO:32),
ARGGTGTRGGRTTTATCTGAACTTGAATYTCAA (SEQ ID NO:33),
GAACCATRGCACARATYARYCCYCCYTGYTGRA (SEQ ID NO:34),
AKGATGCTATHGAACCATARCTYTGGTCACYAG (SEQ ID NO:35),
TGCAATTTAACARACCATGAGGATAAACAGTCA (SEQ ID NO:36), and
ATGGAACCTTTATTCTAACYACATTGTTRATRT (SEQ ID NO:37).

8. The synthetic oligonucleotide of claim 7, wherein said second segment comprises

CTTCTTTGGAGAAAGTGGTG (SEQ ID NO:39).

9. A solution sandwich hybridization assay for detecting the presence of HAV in a sample, comprising

(a) contacting the sample under hybridizing conditions with an excess of (i) amplifier probes comprising the set of synthetic oligonucleotides of claim 5 and (ii) a capture probe oligonucleotide comprising a first segment comprising a nucleotide sequence that is substantially complementary to a segment of HAV RNA and a second segment that is substantially complementary to an oligonucleotide bound to a solid phase;

(b) contacting the product of step (a) under hybridizing conditions with said oligonucleotide bound to the solid phase;

(c) thereafter separating materials not bound to the solid phase;

(d) contacting the bound product of step (c) under hybridization conditions with the nucleic acid multimer, said multimer comprising at least one oligonucleotide unit that is substantially complementary to the second segment of the amplifier probe polynucleotide and a multiplicity of second oligonucleotide units that are substantially complementary to a labeled oligonucleotide;

(e) removing unbound multimer;

(f) contacting under hybridizing conditions the solid phase complex product of step (e) with the labeled oligonucleotide;

(g) removing unbound labeled oligonucleotide; and

(h) detecting the presence of label in the solid phase complex product of step (g).

10. A solution sandwich hybridization assay for detecting the presence of HAV in a sample, comprising (a) contacting the sample under hybridizing conditions with an excess of (i) an amplifier probe oligonucleotide comprising a first segment comprising a nucleotide sequence substantially complementary to a segment of HAV RNA and a

second segment comprising a nucleotide sequence substantially complementary to an oligonucleotide unit of a nucleic acid multimer and (ii) a set of capture probes comprising the set of synthetic oligonucleotides of claim 7;

(b) contacting the product of step (a) under hybridizing conditions with said oligonucleotide bound to the solid phase;

(c) thereafter separating materials not bound to the solid phase;

(d) contacting the bound product of step (c) under hybridization conditions with the nucleic acid multimer, said multimer comprising at least one oligonucleotide unit that is substantially complementary to the second segment of the amplifier probe polynucleotide and a multiplicity of second oligonucleotide units that are substantially complementary to a labeled oligonucleotide;

(e) removing unbound multimer;

(f) contacting under hybridizing conditions the solid phase complex product of step (e) with the labeled oligonucleotide;

(g) removing unbound labeled oligonucleotide; and

(h) detecting the presence of label in the solid phase complex product of step (g).

11. A kit for the detection of HAV in a sample comprising in combination

(i) a set of amplifier probe oligonucleotides wherein the amplifier probe oligonucleotide comprises a first segment comprising a nucleotide sequence substantially complementary to a segment of HAV nucleic acid and a second segment comprising a nucleotide sequence substantially complementary to an oligonucleotide unit of a nucleic acid multimer;

(ii) a set of capture probe oligonucleotides wherein the capture probe oligonucleotide comprises a first

segment comprising a nucleotide sequence that is substantially complementary to a segment of HAV nucleic acid and a second segment that is substantially complementary to an oligonucleotide bound to a solid phase;

(iii) a nucleic acid multimer, said multimer comprising at least one oligonucleotide unit that is substantially complementary to the second segment of the amplifier probe polynucleotide and at least one second oligonucleotide unit that is substantially complementary to a labeled oligonucleotide; and

(iv) a labeled oligonucleotide.

12. The kit of claim 11, further comprising instructions for the use thereof.

13. The kit of claim 11, wherein said set of amplifier probe oligonucleotides comprises the set of synthetic oligonucleotides of claim 5.

14. The kit of claim 11, wherein said set of capture probe oligonucleotides comprises the set of synthetic oligonucleotides of claim 7.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US92/11348

A. CLASSIFICATION OF SUBJECT MATTER

IPC(5) :C12Q 1/68
US CL :436/6
According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 436/5,6,91,235.1; 436/501; 536/22.1,23.1,24.2,24.31,24.32; 935/78

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

APS, MEDLINE, CAS, WPI, BIOTECH ABS, BIOSIS, GENEBANK

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.

[X] Further documents are listed in the continuation of Box C. [ ] See patent family annex.

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be part of particular relevance

"E" earlier document published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&" document member of the same patent family
